

A CLEARER REQUEST, BEFORE THE QUOTE

Five useful details. One reviewable request.

A voice intake assistant for the clarification work that happens before a service professional can quote.

Working prototype • No booking or price promises

Speak → review

Capture the caller's words.
Correct the details.
Download the current draft.

THE PROBLEM

**“Can you give me a quote?”
Usually needs a second conversation.**

The vague request

A service is mentioned, but the practical details are scattered or missing.

The clarification

What equipment? Which area?
How is access? What time works?

The useful handoff

A structured draft with evidence and visible follow-up gaps.

THE PRODUCT

**From a spoken request
to a draft the caller can inspect.**

01

Requested work

02

Equipment /
property

03

Service area

04

Access
constraints

05

Preferred time

Capture → fill gaps → correct → review → download

Unknown and declined answers remain explicit. Corrections invalidate the earlier review.

ARCHITECTURE

A small tool surface. The caller keeps final control.

Private token server

API key remains server-side.
60-second token redemption.
Three-minute hosted session cap.

AssemblyAI voice

24 kHz PCM audio.
Transcripts + spoken replies.
Capture and inspect tools.

Local draft

Exact transcript evidence.
Versioned review.
Explicit local download.

No email, payment, booking or customer-record tool is exposed.

VERIFIED SEPTEMBER 8, 2026

Live browser capture and correction passed with synthesized speech.

26 local tests

Intake rules, HTTP boundaries, audio resampling and parallel tool-result delivery.

5 / 5 fields captured

Real provider transcripts and tool calls captured every required field.

Correction verified

Friday afternoon → Monday morning. The old review was invalidated.

Recorded from the public live app. Microphone connection also checked; broader speaker testing is future work.

CURRENT SCOPE AND NEXT ACCEPTANCE

Ready to inspect. Still a prototype.

Available now

Original MIT-licensed source.
Runnable local voice application.
Evidence-backed draft workflow.

Next evaluation

More accents and noisy microphones.
Service-business usability feedback.
Optional business-side delivery.
